

TRENCH-TITE™ Vibratory Conveyor

Natural Frequency, Eccentric Drive, Trench Mounted

This TRENCH-TITE™ Vibratory Conveyor by Dynamic Air is set into a narrow trench, level with the floor. It is installed in an iron foundry and is used to convey spill sand during a molding operation. Special features include a flexible polymer conveying trough which flexes and prevents any sticky foundry molding sand

from adhering to the vibrating conveyor surface and becoming a maintenance issue. The eccentric drive is located just above the floor for easy maintenance. Installation is simple and easy as it is mounted on angles embedded in the trench wall.
